## **Executive summary**

Human papillomavirus (HPV) infection is now a well-established cause of cervical cancer and there is growing evidence of HPV being a relevant factor in other anogenital cancers (anus, vulva, vagina and penis) and head and neck cancers. HPV types 16 and 18 are responsible for about 70% of all cervical cancer cases worldwide. HPV vaccines that prevent against HPV 16 and 18 infection are now available and have the potential to reduce the incidence of cervical and other anogenital cancers.

This report provides key information for Greece on cervical cancer, other anogenital cancers and head and neck cancers, HPV-related statistics, factors contributing to cervical cancer, cervical cancer screening practices, and HPV vaccine introduction. The report is intended to strengthen the guidance for health policy implementation of primary and secondary cervical cancer prevention strategies in the country.

Table 1: Key Statistics

<b>Population</b>		
Women at risk for cervical cancer (Female population aged ≥15 yrs)		4.60 million
<b>Burden of cervical cancer and other HPV-related cancers</b>		
Annual number of cervical cancer cases		697
Annual number of cervical cancer deaths		282
Crude incidence rates per 100,000 population:	Male	Female
Cervical cancer	-	13.1
Anal cancer	1.21	1.58
Vulva cancer	-	3.20
Vaginal cancer	-	0.28
Penile cancer	1.90	-
Oropharyngeal cancer	1.11	0.40
Oral cavity cancer	7.84	3.81
Laryngeal cancer	14.4	1.41
<b>Burden of cervical HPV infection</b>		
Prevalence (%) of HPV 16 and/or HPV 18 among women with:		
Normal cytology		2.8
Low-grade cervical lesions (LSIL/CIN-1)		21.7
High-grade cervical lesions (HSIL/CIN-2/CIN-3/CIS)		55.4
Cervical cancer		52.3
<b>Other factors contributing to cervical cancer</b>		
Smoking prevalence (%) [95% UI], women		32 [21.8-43.7]
Total fertility rate (live births per women)		1.3
Oral contraceptive use (%)		4.80
HIV prevalence (%) [95% UI], women (15-49 years)		- [—]
<b>Sexual behaviour</b>		
Percentage of 15-year-old who have had sexual intercourse (men/women)		35.0/17.0
Range of median age at first sexual intercourse (men/women)		13.0-17.6/14.5-22.8
<b>Cervical screening practices and recommendations</b>		
Existence of official national recommendations		Yes
Starting year of current recommendations		2018
Active invitation to screening		No
Screening ages (years), primary screening test used, and screening interval or frequency of screenings		≥18 (cytology, 1 year); 21-60 (HPV test, 5 years)
<b>HPV vaccine in females</b>		
HPV vaccination programme		Introduced
Year of introduction		2008
Year of estimation of HPV vaccination coverage		2021
HPV coverage – first dose (%)		-
HPV coverage – last dose (%)		-

\* Please see the specific sections for more information.

<b>Executive summary</b>	<b>iii</b>
<b>1 Introduction</b>	<b>2</b>
<b>2 Demographic and socioeconomic factors</b>	<b>4</b>
<b>3 Burden of HPV related cancers</b>	<b>5</b>
3.1 HPV related cancers incidence . . . . .	5
3.2 HPV related cancers mortality . . . . .	7
3.3 Cervical cancer . . . . .	9
3.3.1 Cervical cancer incidence in Greece . . . . .	9
3.3.2 Cervical cancer incidence by histology in Greece . . . . .	12
3.3.3 Cervical cancer mortality in Greece . . . . .	15
3.3.4 Cervical cancer incidence and mortality comparison in Greece . . . . .	17
3.4 Anogenital cancers other than the cervix . . . . .	19
3.4.1 Anal cancer . . . . .	19
3.4.1.1 Anal cancer incidence in Greece . . . . .	19
3.4.1.2 Anal cancer mortality in Greece . . . . .	21
3.4.1.3 Anal cancer incidence and mortality comparison in Greece . . . . .	23
3.4.2 Vulva cancer . . . . .	24
3.4.2.1 Vulva cancer incidence in Greece . . . . .	24
3.4.2.2 Vulva cancer mortality in Greece . . . . .	26
3.4.2.3 Vulva cancer incidence and mortality comparison in Greece . . . . .	28
3.4.3 Vaginal cancer . . . . .	29
3.4.3.1 Vaginal cancer incidence in Greece . . . . .	29
3.4.3.2 Vaginal cancer mortality in Greece . . . . .	31
3.4.3.3 Vaginal cancer incidence and mortality comparison in Greece . . . . .	33
3.4.4 Penile cancer . . . . .	34
3.4.4.1 Penile cancer incidence in Greece . . . . .	34
3.4.4.2 Penile cancer mortality in Greece . . . . .	36
3.4.4.3 Penile cancer incidence and mortality comparison in Greece . . . . .	38
3.5 Head and neck cancers . . . . .	39
3.5.1 Oropharyngeal cancer . . . . .	39
3.5.1.1 Oropharyngeal cancer incidence in Greece . . . . .	39
3.5.1.2 Oropharyngeal cancer mortality in Greece . . . . .	41
3.5.1.3 Oropharyngeal cancer incidence and mortality comparison in Greece . . . . .	43
3.5.2 Oral cavity cancer . . . . .	44
3.5.2.1 Oral cavity cancer incidence in Greece . . . . .	44
3.5.2.2 Oral cavity cancer incidence and mortality comparison in Greece . . . . .	46
3.5.2.3 Oral cavity cancer incidence and mortality comparison in Greece . . . . .	48
3.5.3 Laryngeal cancer . . . . .	49
3.5.3.1 Laryngeal cancer incidence in Greece . . . . .	49
3.5.3.2 Laryngeal cancer incidence and mortality comparison in Greece . . . . .	51
3.5.3.3 Laryngeal cancer incidence and mortality comparison in Greece . . . . .	53
<b>4 HPV related statistics</b>	<b>54</b>
4.1 HPV burden in women with normal cervical cytology, cervical precancerous lesions or invasive cervical cancer . . . . .	54
4.1.1 HPV prevalence in women with normal cervical cytology . . . . .	55
4.1.2 HPV type distribution among women with normal cervical cytology, precancerous cervical lesions and cervical cancer . . . . .	56
4.1.3 HPV type distribution among HIV+ women with normal cervical cytology . . . . .	66

4.1.4	Terminology . . . . .	67
4.2	HPV burden in anogenital cancers other than cervix . . . . .	68
4.2.1	Anal cancer and precancerous anal lesions . . . . .	69
4.2.2	Vulvar cancer and precancerous vulvar lesions . . . . .	71
4.2.3	Vaginal cancer and precancerous vaginal lesions . . . . .	73
4.2.4	Penile cancer and precancerous penile lesions . . . . .	75
4.3	HPV burden in men . . . . .	77
4.4	HPV burden in the head and neck . . . . .	78
4.4.1	Burden of oral HPV infection in healthy population . . . . .	78
4.4.2	HPV burden in head and neck cancers . . . . .	79

## List of Figures

1	Greece and Southern Europe . . . . .	2
2	Population pyramid of Greece for 2022 . . . . .	4
3	Population trends in four selected age groups in Greece . . . . .	4
4	Comparison of HPV related cancers incidence to other cancers in men and women of all ages in Greece (estimates for 2020) . . . . .	5
5	Comparison of HPV related cancers incidence to other cancers among men and women 15-44 years of age in Greece (estimates for 2020) . . . . .	6
6	Comparison of HPV related cancers mortality to other cancers in men and women of all ages in Greece (estimates for 2020) . . . . .	7
7	Comparison of HPV related cancers mortality to other cancers among men and women 15-44 years of age in Greece (estimates for 2020) . . . . .	8
8	Age-specific incidence rates of cervical cancer in Greece (estimates for 2020) . . . . .	11
9	Annual number of new cases of cervical cancer in Greece (estimates for 2020) . . . . .	11
10	Time trends in cervical cancer incidence in Greece (cancer registry data) . . . . .	14
11	Age-specific mortality rates of cervical cancer in Greece (estimates for 2020) . . . . .	16
12	Annual number of deaths of cervical cancer in Greece (estimates for 2020) . . . . .	16
13	Comparison of age-specific cervical cancer incidence and mortality rates in Greece (estimates for 2020) . . . . .	17
14	Comparison of annual premature deaths and disability from cervical cancer in Greece to other cancers among women (estimates for 2019) . . . . .	18
15	Age-specific incidence rates of anal cancer in Greece (estimates for 2020) . . . . .	20
16	Annual number of new cases of anal cancer in Greece (estimates for 2020) . . . . .	20
17	Age-specific mortality rates of anal cancer in Greece (estimates for 2020) . . . . .	22
18	Annual number of deaths of anal cancer in Greece (estimates for 2020) . . . . .	22
19	Comparison of age-specific anal cancer incidence and mortality rates among men in Greece (estimates for 2020) . . . . .	23
20	Comparison of age-specific anal cancer incidence and mortality rates among women in Greece (estimates for 2020) . . . . .	23
21	Age-specific incidence rates of vulva cancer in Greece (estimates for 2020) . . . . .	25
22	Annual number of new cases of vulva cancer in Greece (estimates for 2020) . . . . .	25
23	Age-specific mortality rates of vulva cancer in Greece (estimates for 2020) . . . . .	27
24	Annual number of deaths of vulva cancer in Greece (estimates for 2020) . . . . .	27
25	Comparison of age-specific vulva cancer incidence and mortality rates in Greece (estimates for 2020) . . . . .	28
26	Age-specific incidence rates of vaginal cancer in Greece (estimates for 2020) . . . . .	30
27	Annual number of new cases of vaginal cancer in Greece (estimates for 2020) . . . . .	30
28	Age-specific mortality rates of vaginal cancer in Greece (estimates for 2020) . . . . .	32
29	Annual number of deaths of vaginal cancer in Greece (estimates for 2020) . . . . .	32
30	Comparison of age-specific vaginal cancer incidence and mortality rates in Greece (estimates for 2020) . . . . .	33
31	Age-specific incidence rates of penile cancer in Greece (estimates for 2020) . . . . .	35
32	Annual number of new cases of penile cancer in Greece (estimates for 2020) . . . . .	35
33	Age-specific mortality rates of penile cancer in Greece (estimates for 2020) . . . . .	37
34	Annual number of deaths of penile cancer in Greece (estimates for 2020) . . . . .	37
35	Comparison of age-specific penile cancer incidence and mortality rates in Greece (estimates for 2020) . . . . .	38
36	Age-specific incidence rates of oropharyngeal cancer in Greece (estimates for 2020) . . . . .	40
37	Annual number of new cases of oropharyngeal cancer in Greece (estimates for 2020) . . . . .	40
38	Age-specific mortality rates of oropharyngeal cancer in Greece (estimates for 2020) . . . . .	42
39	Annual number of deaths of oropharyngeal cancer in Greece (estimates for 2020) . . . . .	42
40	Comparison of age-specific oropharyngeal cancer incidence and mortality rates among men in Greece (estimates for 2020) . . . . .	43
41	Comparison of age-specific oropharyngeal cancer incidence and mortality rates among women in Greece (estimates for 2020) . . . . .	43
42	Age-specific incidence rates of oral cavity cancer in Greece (estimates for 2020) . . . . .	45
43	Annual number of new cases of oral cavity cancer in Greece (estimates for 2020) . . . . .	45
44	Age-specific mortality rates of oral cavity cancer in Greece (estimates for 2020) . . . . .	47
45	Annual number of deaths of oral cavity cancer in Greece (estimates for 2020) . . . . .	47
46	Comparison of age-specific oral cavity cancer incidence and mortality rates among men in Greece (estimates for 2020) . . . . .	48
47	Comparison of age-specific oral cavity cancer incidence and mortality rates among women in Greece (estimates for 2020) . . . . .	48
48	Age-specific incidence rates of laryngeal cancer in Greece (estimates for 2020) . . . . .	50
49	Annual number of new cases of laryngeal cancer in Greece (estimates for 2020) . . . . .	50
50	Age-specific mortality rates of laryngeal cancer in Greece (estimates for 2020) . . . . .	52
51	Annual number of deaths of laryngeal cancer in Greece (estimates for 2020) . . . . .	52
52	Comparison of age-specific laryngeal cancer incidence and mortality rates among men in Greece (estimates for 2020) . . . . .	53

53	Comparison of age-specific laryngeal cancer incidence and mortality rates among women in Greece (estimates for 2020)	53
54	Crude age-specific HPV prevalence (%) and 95% confidence interval in women with normal cervical cytology in Greece	55
55	HPV prevalence among women with normal cervical cytology in Greece, by study	55
56	HPV 16 prevalence among women with normal cervical cytology in Greece, by study	56
57	HPV 16 prevalence among women with low-grade cervical lesions in Greece, by study	57
58	HPV 16 prevalence among women with high-grade cervical lesions in Greece, by study	57
59	HPV 16 prevalence among women with invasive cervical cancer in Greece, by study	58
60	Comparison of the ten most frequent HPV oncogenic types in Greece among women with and without cervical lesions	59
61	Comparison of the ten most frequent HPV oncogenic types in Greece among women with invasive cervical cancer by histology	61
62	Comparison of the ten most frequent HPV types in anal cancer cases in Europe and the World	70
63	Comparison of the ten most frequent HPV types in AIN 2/3 cases in Europe and the World	70
64	Comparison of the ten most frequent HPV types in cases of vulvar cancer in Europe and the World	72
65	Comparison of the ten most frequent HPV types in VIN 2/3 cases in Europe and the World	72
66	Comparison of the ten most frequent HPV types in cases of vaginal cancer in Europe and the World	74
67	Comparison of the ten most frequent HPV types in VaIN 2/3 cases in Europe and the World	74
68	Comparison of the ten most frequent HPV types in cases of penile cancer in Europe and the World	76
69	Comparison of the ten most frequent HPV types in PeIN 2/3 cases in Europe and the World	76
70	Estimated coverage* of cervical cancer screening in Greece	86
71	HPV vaccination coverage in females by year in Greece	87
72	HPV vaccination coverage in males by year in Greece	88
73	Age-standardised incidence rates of cervical cancer of Greece (estimates for 2020)	90
74	Annual number of new cases of cervical cancer by age group in Greece (estimates for 2020)	91
75	Comparison of age-specific cervical cancer incidence rates in Greece, within the region, and the rest of world	92
76	Age-standardised incidence rates of anal cancer of Greece (estimates for 2020)	93
77	Annual number of new cases of anal cancer among men by age group in Greece (estimates for 2020)	94
78	Annual number of new cases of anal cancer among women by age group in Greece (estimates for 2020)	95
79	Comparison of age-specific anal cancer incidence rates among men by age in Greece, within the region, and the rest of world	96
80	Comparison of age-specific anal cancer incidence rates among women by age in Greece, within the region, and the rest of world	97
81	Age-standardised incidence rates of vulva cancer of Greece (estimates for 2020)	98
82	Annual number of new cases of vulva cancer by age group in Greece (estimates for 2020)	99
83	Comparison of age-specific vulva cancer incidence rates in Greece, within the region, and the rest of world	100
84	Age-standardised incidence rates of vaginal cancer of Greece (estimates for 2020)	101
85	Annual number of new cases of cervical cancer by age group in Greece (estimates for 2020)	102
86	Comparison of age-specific vaginal cancer incidence rates in Greece, within the region, and the rest of world	103
87	Age-standardised incidence rates of penile cancer of Greece (estimates for 2020)	104
88	Annual number of new cases of penile cancer by age group in Greece (estimates for 2020)	105
89	Comparison of age-specific penile cancer incidence rates in Greece, within the region, and the rest of world	106
90	Age-standardised incidence rates of oropharyngeal cancer of Greece (estimates for 2020)	107
91	Annual number of new cases of oropharyngeal cancer among men by age group in Greece (estimates for 2020)	108
92	Annual number of new cases of oropharyngeal cancer among women by age group in Greece (estimates for 2020)	109
93	Comparison of age-specific oropharyngeal cancer incidence rates among men by age in Greece, within the region, and the rest of world	110
94	Comparison of age-specific oropharyngeal cancer incidence rates among women by age in Greece, within the region, and the rest of world	111
95	Age-standardised incidence rates of oral cavity cancer of Greece (estimates for 2020)	112
96	Annual number of new cases of oral cavity cancer among men by age group in Greece (estimates for 2020)	113
97	Annual number of new cases of oral cavity cancer among women by age group in Greece (estimates for 2020)	114
98	Comparison of age-specific oral cavity cancer incidence rates among men by age in Greece, within the region, and the rest of world	115
99	Comparison of age-specific oral cavity cancer incidence rates among women by age in Greece, within the region, and the rest of world	116
100	Age-standardised incidence rates of laryngeal cancer of Greece (estimates for 2020)	117
101	Annual number of new cases of laryngeal cancer among men by age group in Greece (estimates for 2020)	118
102	Annual number of new cases of laryngeal cancer among women by age group in Greece (estimates for 2020)	119
103	Comparison of age-specific laryngeal cancer incidence rates among men by age in Greece, within the region, and the rest of world	120
104	Comparison of age-specific laryngeal cancer incidence rates among women by age in Greece, within the region, and the rest of world	121
105	Age-standardised mortality rates of cervical cancer of Greece (estimates for 2020)	122

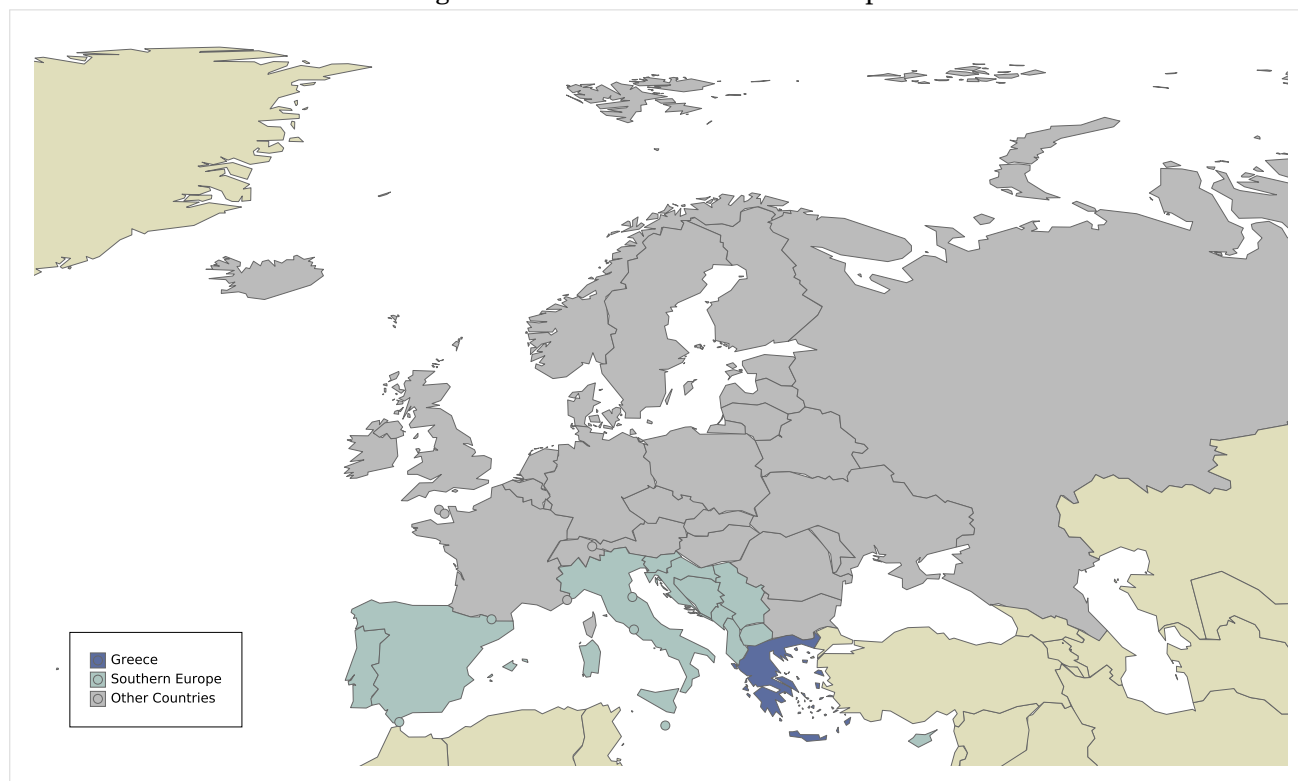

106	Annual number of deaths of cervical cancer by age group in Greece (estimates for 2020)	123
107	Comparison of age-specific cervical cancer mortality rates in Greece, within the region, and the rest of world	124
108	Age-standardised mortality rates of anal cancer of Greece (estimates for 2020)	125
109	Annual number of deaths of anal cancer among men by age group in Greece (estimates for 2020)	126
110	Annual number of deaths of anal cancer among women by age group in Greece (estimates for 2020)	127
111	Comparison of age-specific anal cancer mortality rates among men by age in Greece, within the region, and the rest of world	128
112	Comparison of age-specific anal cancer mortality rates among women by age in Greece, within the region, and the rest of world	129
113	Age-standardised mortality rates of vulva cancer of Greece (estimates for 2020)	130
114	Annual number of deaths of vulva cancer by age group in Greece (estimates for 2020)	131
115	Comparison of age-specific vulva cancer mortality rates in Greece, within the region, and the rest of world	132
116	Age-standardised mortality rates of vaginal cancer of Greece (estimates for 2020)	133
117	Annual number of deaths of cervical cancer by age group in Greece (estimates for 2020)	134
118	Comparison of age-specific vaginal cancer mortality rates in Greece, within the region, and the rest of world	135
119	Age-standardised mortality rates of penile cancer of Greece (estimates for 2020)	136
120	Annual number of new deaths of penile cancer by age group in Greece (estimates for 2020)	137
121	Comparison of age-specific penile cancer mortality rates in Greece, within the region, and the rest of world	138
122	Age-standardised mortality rates of oropharyngeal cancer of Greece (estimates for 2020)	139
123	Annual number of deaths of oropharyngeal cancer among men by age group in Greece (estimates for 2020)	140
124	Annual number of deaths of oropharyngeal cancer among women by age group in Greece (estimates for 2020)	141
125	Comparison of age-specific oropharyngeal cancer mortality rates among men by age in Greece, within the region, and the rest of world	142
126	Comparison of age-specific oropharyngeal cancer mortality rates among women by age in Greece, within the region, and the rest of world	143
127	Age-standardised mortality rates of oral cavity cancer of Greece (estimates for 2020)	144
128	Annual number of deaths of oral cavity cancer among men by age group in Greece (estimates for 2020)	145
129	Annual number of deaths of oral cavity cancer among women by age group in Greece (estimates for 2020)	146
130	Comparison of age-specific oral cavity cancer mortality rates among men by age in Greece, within the region, and the rest of world	147
131	Comparison of age-specific oral cavity cancer mortality rates among women by age in Greece, within the region, and the rest of world	148
132	Age-standardised mortality rates of laryngeal cancer of Greece (estimates for 2020)	149
133	Annual number of deaths of laryngeal cancer among men by age group in Greece (estimates for 2020)	150
134	Annual number of deaths of laryngeal cancer among women by age group in Greece (estimates for 2020)	151
135	Comparison of age-specific laryngeal cancer mortality rates among men by age in Greece, within the region, and the rest of world	152
136	Comparison of age-specific laryngeal cancer mortality rates among women by age in Greece, within the region, and the rest of world	153

## List of Tables

1	Key Statistics	iv
2	Cervical cancer incidence in Greece (estimates for 2020)	9
3	Cervical cancer incidence in Greece by cancer registry	10
4	Age-standardised incidence rates of cervical cancer in Greece by histological type and cancer registry	12
5	Cervical cancer mortality in Greece (estimates for 2020)	15
6	Premature deaths and disability from cervical cancer in Greece, Europe and the rest of the world (estimates for 2019)	17
7	Anal cancer incidence in Greece (estimates for 2020)	19
8	Anal cancer mortality in Greece (estimates for 2020)	21
9	Vulva cancer incidence in Greece (estimates for 2020)	24
10	Vulva cancer mortality in Greece (estimates for 2020)	26
11	Vaginal cancer incidence in Greece (estimates for 2020)	29
12	Vaginal cancer mortality in Greece (estimates for 2020)	31
13	Penile cancer incidence in Greece (estimates for 2020)	34
14	Penile cancer mortality in Greece (estimates for 2020)	36
15	Oropharyngeal cancer incidence in Greece (estimates for 2020)	39
16	Oropharyngeal cancer mortality in Greece (estimates for 2020)	41
17	Oral cavity cancer incidence in Greece (estimates for 2020)	44

# 1 Introduction

Figure 1: Greece and Southern Europe

Information Centre aims to compile and centralise updated data and statistics on human papillomavirus (HPV) and related cancers. This report aims to summarise the data available to fully evaluate the burden of disease in Greece and to facilitate stakeholders and relevant bodies of decision makers to formulate recommendations on the prevention of cervical cancer and other HPV-related cancers. Data include relevant cancer statistic estimates, epidemiological determinants of cervical cancer such as demographics, socioeconomic factors, risk factors, burden of HPV infection in women and men, cervical screening and immunization practices. The report is structured into the following sections:

**Section 2, Demographic and socioeconomic factors.** This section summarises the socio-demographic profile of Greece. For analytical purposes, Greece is classified in the geographical region of Southern Europe (Figure 1, lighter blue), which is composed of the following countries: Andorra, Bosnia and Herzegovina, Cyprus, Spain, Gibraltar, Croatia, Italy, Republic of North Macedonia, Malta, Montenegro, Portugal, San Marino, Serbia, Slovenia, and Holy See. Throughout the report, Greece estimates will be complemented with corresponding regional estimates.

**Section 3, Burden of HPV related cancers.** This section describes the current burden of invasive cervical cancer and other HPV-related cancers in Greece with estimates of prevalence, incidence, and mortality rates. Information in other HPV-related cancers includes other anogenital cancers (anus, vulva, vagina, and penis) and head and neck cancers (oral cavity, oropharyngeal, and larynx).

**Section 4, HPV related statistics.** This section reports on prevalence of HPV and HPV type-specific distribution in Greece, in women with normal cytology, precancerous lesions and invasive cervical cancer. In addition, the burden of HPV in other anogenital cancers (anus, vulva, vagina, and penis), head and neck cancers (oral cavity, oropharynx, and larynx) and men are presented.

**Section 5, Factors contributing to cervical cancer.** This section describes factors that can modify the natural history of HPV and cervical carcinogenesis such as smoking, parity, oral contraceptive use,

and co-infection with HIV.

**Section 6, Sexual and reproductive health behaviour indicators.** This section presents sexual and reproductive behaviour indicators that may be used as proxy measures of risk for HPV infection and anogenital cancers, such as age at first sexual intercourse, average number of sexual partners, and anal intercourse among others.

**Section 7, HPV preventive strategies.** This section presents preventive strategies that include basic characteristics and performance of cervical cancer screening status, status of HPV vaccine licensure introduction, and recommendations in national immunisation programmes.

**Section 8, Protective factors for cervical cancer.** This section presents male circumcision and the use of condoms.

## 2 Demographic and socioeconomic factors

### 3 Burden of HPV related cancers

HPV is the cause of almost all cervical cancer cases and is responsible for an important fraction of other anogenital and head and neck cancer. Here, we present the most recent estimations on the burden of HPV-associated cancer.

#### 3.1 HPV related cancers incidence

Figure 4: Comparison of HPV related cancers incidence to other cancers in men and women of all ages in Greece (estimates for 2020)

Data accessed on 27 Jan 2021

For more detailed methods of estimation please refer to <http://gco.iarc.fr/today/data-sources-methods>

Non-melanoma skin cancer is not included

Rates per 100,000 men per year.

Rates per 100,000 women per year.

Data Sources:

Figure 5: Comparison of HPV related cancers incidence to other cancers among men and women 15-44 years of age in Greece (estimates for 2020)

Data accessed on 27 Jan 2021

For more detailed methods of estimation please refer to <http://gco.iarc.fr/today/data-sources-methods>

Non-melanoma skin cancer is not included

Rates per 100,000 men per year.

Rates per 100,000 women per year.

Data Sources:

Ferlay J, Ervik M, Lam F, Colombet M, Mery L, Piñeros M, Znaor A, Soerjomataram I, Bray F (2020). Global Cancer Observatory: Cancer Today. Lyon, France: International Agency for Research on Cancer. Available from: <https://gco.iarc.fr/today>, accessed [27 January 2021].

### 3.2 HPV related cancers mortality

Figure 6: Comparison of HPV related cancers mortality to other cancers in men and women of all ages in Greece (estimates for 2020)

Data accessed on 27 Jan 2021

For more detailed methods of estimation please refer to <http://gco.iarc.fr/today/data-sources-methods>

Non-melanoma skin cancer is not included

Rates per 100,000 men per year.

Rates per 100,000 women per year.

Data Sources:

Ferlay J, Ervik M, Lam F, Colombet M, Mery L, Piñeros M, Znaor A, Soerjomataram I, Bray F (2020). Global Cancer Observatory: Cancer Today. Lyon, France: International Agency for Research on Cancer. Available from: <https://gco.iarc.fr/today>, accessed [27 January 2021].

Figure 7: Comparison of HPV related cancers mortality to other cancers among men and women 15-44 years of age in Greece (estimates for 2020)

Data accessed on 27 Jan 2021

For more detailed methods of estimation please refer to <http://gco.iarc.fr/today/data-sources-methods>

Non-melanoma skin cancer is not included

Rates per 100,000 men per year.

Rates per 100,000 women per year.

Data Sources:

Ferlay J, Ervik M, Lam F, Colombet M, Mery L, Piñeros M, Znaor A, Soerjomataram I, Bray F (2020). Global Cancer Observatory: Cancer Today. Lyon, France: International Agency for Research on Cancer. Available from: <https://gco.iarc.fr/today>, accessed [27 January 2021].

### 3.3 Cervical cancer

Cancer of the cervix uteri is the 4<sup>th</sup> most common cancer among women worldwide, with an estimated 604,127 new cases and 341,831 deaths in 2020. Worldwide, mortality rates of cervical cancer are substantially lower than incidence with a ratio of mortality to incidence to 57% (GLOBOCAN 2020). The majority of cases are squamous cell carcinoma followed by adenocarcinomas. (*Vaccine 2006, Vol. 24, Suppl 3; Vaccine 2008, Vol. 26, Suppl 10; Vaccine 2012, Vol. 30, Suppl 5; IARC Monographs 2007, Vol. 90*)

This section describes the current burden of invasive cervical cancer in Greece and in comparison to geographic region, including estimates of the annual number of new cases, deaths, incidence, and mortality rates.

#### 3.3.1 Cervical cancer incidence in Greece

##### Key Stats.

About **697 new cervical cancer cases** are diagnosed **annually** in **Greece** (estimations for 2020).

Cervical cancer **ranks\*** as the **10<sup>th</sup> leading cause** of female cancer in **Greece**.

Cervical cancer is the **3<sup>rd</sup> most common** female cancer in **women aged 15 to 44 years in Greece**.

\* Ranking of cervical cancer incidence to other cancers among all women according to highest incidence rates (ranking 1st) excluding non-melanoma skin cancer. Ranking is based on crude incidence rates (actual number of cervical cancer cases). Ranking using age-standardized rate (ASR) may differ.

Table 2: Cervical cancer incidence in Greece (estimates for 2020)

Indicator	Greece	Southern Europe	World
Annual number of new cancer cases	697	9,053	604,127
Uncertainty intervals of new cancer cases [95% UI]	[530-917]	[8,181-10,018]	[582,031-627,062]
Crude incidence rate <sup>b</sup>	13.1	11.5	15.6
Age-standardized incidence rate <sup>b</sup>	8.05	7.72	13.3
Cumulative risk (%) at 75 years old <sup>a</sup>	0.77	0.76	1.39

Data accessed on 27 Jan 2021

For more detailed methods of estimation please refer to <http://gco.iarc.fr/today/data-sources-methods>

<sup>a</sup> Cumulative risk (incidence) is the probability or risk of individuals getting from the disease during ages 0-74 years. For cancer, it is expressed as the % of new born children who would be expected to develop from a particular cancer before the age of 75 if they had the rates of cancer observed in the period in the absence of competing causes.

<sup>b</sup> Rates per 100,000 women per year.

Data Sources:

Ferlay J, Ervik M, Lam F, Colombet M, Mery L, Piñeros M, Znaor A, Soerjomataram I, Bray F (2020). Global Cancer Observatory: Cancer Today. Lyon, France: International Agency for Research on Cancer. Available from: <https://gco.iarc.fr/today>, accessed [27 January 2021].

Table 3: Cervical cancer incidence in Greece by cancer registry

Cancer registry	Period	N cases <sup>a</sup>	Crude rate <sup>b</sup>	ASR <sup>b</sup>
-	-	-	-	-

**Data accessed on 5 Oct 2018**

Please refer to original source (available at <http://ci5.iarc.fr/Ci5-XI/Default.aspx>)

ASR: Age-standardized rate, Standardized rates have been estimated using the direct method and the World population as the reference.

<sup>a</sup> Accumulated number of cases during the period in the population covered by the corresponding registry.

<sup>b</sup> Rates per 100,000 women per year.

Figure 8: Age-specific incidence rates of cervical cancer in Greece (estimates for 2020)

Data accessed on 27 Jan 2021

For more detailed methods of estimation please refer to <http://gco.iarc.fr/today/data-sources-methods>

<sup>a</sup> Rates per 100,000 women per year.

Data Sources:

Ferlay J, Ervik M, Lam F, Colombet M, Mery L, Piñeros M, Znaor A, Soerjomataram I, Bray F (2020). Global Cancer Observatory: Cancer Today. Lyon, France: International Agency for Research on Cancer. Available from: <https://gco.iarc.fr/today>, accessed [27 January 2021].

Figure 9: Annual number of new cases of cervical cancer in Greece (estimates for 2020)

Data accessed on 27 Jan 2021

For more detailed methods of estimation please refer to <http://gco.iarc.fr/today/data-sources-methods>

Data Sources:

Ferlay J, Ervik M, Lam F, Colombet M, Mery L, Piñeros M, Znaor A, Soerjomataram I, Bray F (2020). Global Cancer Observatory: Cancer Today. Lyon, France: International Agency for Research on Cancer. Available from: <https://gco.iarc.fr/today>, accessed [27 January 2021].

GBD 2019 Diseases and Injuries Collaborators. Global burden of 369 diseases and injuries in 204 countries and territories, 1990-2019: a systematic analysis for the Global Burden of Disease Study 2019. *Lancet*. 2020 Oct 17;396(10258):1204-1222

### 3.4 Anogenital cancers other than the cervix

Data on HPV role in anogenital cancers other than cervix are limited, but there is an increasing body of evidence strongly linking HPV DNA with cancers of anus, vulva, vagina, and penis. Although these cancers are much less frequent compared to cervical cancer, their association with HPV make them potentially preventable and subject to similar preventative strategies as those for cervical cancer. (Vaccine 2006, Vol. 24, Suppl 3; Vaccine 2008, Vol. 26, Suppl 10; Vaccine 2012, Vol. 30, Suppl 5; IARC Monographs 2007, Vol. 90).

#### 3.4.1 Anal cancer

Anal cancer is rare in the general population with an average worldwide incidence of 1 per 100,000, but is reported to be increasing in more developed regions. Globally, there are an estimated 29,000 new cases in 2018 every year (de Martel C et al. Lancet Glob Health 2020;8(2):e180-e190). Women have higher incidences of anal cancer than men. Incidence is particularly high among populations of men who have sex with men (MSM), women with history of cervical or vulvar cancer, and immunosuppressed populations, including those who are HIV-infected and patients with a history of organ transplantation. These cancers are predominantly squamous cell carcinoma, adenocarcinomas, or basaloid and cloacogenic carcinomas.

##### 3.4.1.1 Anal cancer incidence in Greece

Table 7: Anal cancer incidence in Greece (estimates for 2020)

Indicator	Greece	Southern Europe	World
<b>MEN</b>			
Annual number of new cancer cases	62	966	21,706

### 3.4.2 Vulva cancer

Cancer of the vulva is rare among women worldwide, with an estimated 44,000 new cases in 2018, representing 6% of all gynaecologic cancers (de Martel C et al. Lancet Glob Health 2020;8(2):e180-e190). Worldwide, about 60% of all vulvar cancer cases occur in more developed countries. Vulvar cancer has two distinct histological patterns with two different risk factor profiles: (1) basaloid/warty types (2) keratinising types. Basaloid/warty lesions are more common in young women, are very often associated with HPV DNA detection (75-100%), and have a similar risk factor profile as cervical cancer. Keratinising vulvar carcinomas represent the majority of the vulvar lesions (>60%), they occur more often in older women and are more rarely associated with HPV (IARC Monograph Vol 100B).

#### 3.4.2.1 Vulva cancer incidence in Greece

Table 9: Vulva cancer incidence in Greece (estimates for 2020)

Indicator	Greece	Southern Europe	World
Annual number of new cancer cases	170	3,048	45,240
Uncertainty intervals [95% UI]	[126-230]	[2,592-3,584]	[40,656-50,342]
Crude incidence rate <sup>b</sup>	3.20	3.89	1.17
Age-standardized incidence rate <sup>b</sup>	0.87	1.35	0.85
Cumulative risk (%) at 75 years old <sup>a</sup>	0.09	0.15	0.09

**Data accessed on 27 Jan 2021**

For more detailed methods of estimation please refer to <http://gco.iarc.fr/today/data-sources-methods>

<sup>a</sup> Cumulative risk (incidence) is the probability or risk of individuals getting from the disease during ages 0-74 years. For cancer, it is expressed as the % of new born children who would be expected to develop from a particular cancer before the age of 75 if they had the rates of cancer observed in the period in the absence of competing causes.

<sup>b</sup> Rates per 100,000 women per year.

**Data Sources:**

Ferlay J, Ervik M, Lam F, Colombet M, Mery L, Piñeros M, Znaor A, Soerjomataram I, Bray F (2020). Global Cancer Observatory: Cancer Today. Lyon, France: International Agency for Research on Cancer. Available from: <https://gco.iarc.fr/today>, accessed [27 January 2021].

### 3.4.3 Vaginal cancer

Cancer of the vagina is a rare cancer, with an estimated 18,000 new cases in 2018, representing 3% of all gynaecologic cancers (de Martel C et al. Lancet Glob Health 2020;8(2):e180-e190). Similar to cervical cancer, the majority of vaginal cancer cases (68%) occur in less developed countries. Most vaginal cancers are squamous cell carcinoma (90%) generally attributable to HPV, followed by clear cell adenocarcinomas and melanoma. Vaginal cancers are primarily reported in developed countries. Metastatic cervical cancer can be misclassified as cancer of the vagina. Invasive vaginal cancer is diagnosed primarily in old women ( $\geq 65$  years) and the diagnosis is rare in women under 45 years whereas the peak incidence of carcinoma in situ is observed between ages 55 and 70 (Vaccine 2008, Vol. 26, Suppl 10).

#### 3.4.3.1 Vaginal cancer incidence in Greece

Table 11: Vaginal cancer incidence in Greece (estimates for 2020)

Indicator	Greece	Southern Europe	World
Annual number of new cancer cases	15	553	17,908
Uncertainty intervals [95% UI]	[5-42]	[385-794]	[14,678-21,848]
Crude incidence rate <sup>b</sup>	0.28	0.70	0.46
Age-standardized incidence rate <sup>b</sup>	0.13	0.29	0.36

### 3.4.4 Penile cancer

The annual burden of penile cancer has been estimated to be 34,000 cases in 2018 worldwide with incidence rates strongly correlating with those of cervical cancer (de Martel C et al. Lancet Glob Health 2020;8(2):e180-e190). Penile cancer is rare and most commonly affects men aged 50-70 years. Incidence rates are higher in less developed countries than in more developed countries, accounting for up to 10% of male cancers in some parts of Africa, South America and Asia. Precursor cancerous penile lesions (PeIN) are rare.

Cancers of the penis are primarily of squamous cell carcinomas (SCC) (95%) and the most common penile SCC histologic sub-types are keratinising (49%), mixed warty-basaloid (17%), verrucous (8%) warty (6%), and basaloid (4%). HPV is most commonly detected in basaloid and warty tumours but is less common in keratinising and verrucous tumours. Approximately 60-100% of PeIN lesions are HPV DNA positive.

#### 3.4.4.1 Penile cancer incidence in Greece

Table 13: Penile cancer incidence in Greece (estimates for 2020)

Indicator	Greece	Southern Europe	World

### 3.5 Head and neck cancers

The majority of head and neck cancers are associated with high tobacco and alcohol consumption. However, increasing trends in the incidence at specific sites suggest that other aetiological factors are involved, and infection by certain high-risk types of HPV (i.e. HPV16) have been reported to be associated with head and neck cancers, in particular with oropharyngeal cancer. Current evidence suggests that HPV16 is associated with tonsil cancer (including Waldeyer ring cancer), base of tongue cancer and other oropharyngeal cancer sites. Associations with other head and neck cancer sites such as oral cancer are neither strong nor consistent when compared to molecular-epidemiological data on HPV and oropharyngeal cancer. Association with laryngeal cancer is still unclear (IARC Monograph Vol 100B)

#### 3.5.1 Oropharyngeal cancer

##### 3.5.1.1 Oropharyngeal cancer incidence in Greece

## 3.5.1.2 Oropharyngeal cancer mortality in Greece

Table 16: Oropharyngeal cancer mortality in Greece (estimates for 2020)

Indicator	Greece	Southern Europe	World
<b>MEN</b>			
Annual number of deaths	34	1,605	39,590
Uncertainty intervals of mortality cancer cases [95% UI]	[23-51]	[1,446-1,782]	[35,255-44,458]
Crude mortality rate sa <sup>b</sup>	0.66	2.14	1.01
Age-standardized mortality rate sa <sup>b</sup>	0.31	1.07	0.89
Cumulative risk (%) at 75 years old <sup>a</sup>	0.04	0.13	0.11
<b>WOMEN</b>			
Annual number of deaths	12	393	8,553
Uncertainty intervals of mortality cancer cases [95% UI]	[6-23]	[324-478]	[6,684-10,945]
Crude mortality rate sa <sup>c</sup>	0.23	0.50	0.22
Age-standardized mortality rate sa <sup>c</sup>	0.07	0.19	0.17
Cumulative risk (%) at 75 years old <sup>a</sup>	0.01	0.02	0.02

**Data accessed on 27 Jan 2021**

For more detailed methods of estimation please refer to <http://gco.iarc.fr/today/data-sources-methods>

<sup>a</sup> Cumulative risk (mortality) is the probability or risk of individuals dying from the disease during ages 0-74 years. For cancer, it is expressed as the % of new born children who would be expected to die from a particular cancer before the age of 75 if they had the rates of cancer observed in the period in the absence of competing causes.

<sup>b</sup> Rates per 100,000 men per year.

<sup>c</sup> Rates per 100,000 women per year.

## 4 HPV related statistics

HPV infection is commonly found in the anogenital tract of men and women with and without clinical lesions. The aetiological role of HPV infection among women with cervical cancer is well-established, and there is growing evidence of its central role in other anogenital sites. HPV is also responsible for other diseases such as recurrent juvenile respiratory papillomatosis and genital warts, both mainly caused by HPV types 6 and 11 (Lacey CJ, Vaccine 2006; 24(S3):35). For this section, the methodologies used to compile the information on HPV burden are derived from systematic reviews and meta-analyses of the literature. Due to the limitations of HPV DNA detection methods and study designs used, these data should be interpreted with caution and used only as a guide to assess the burden of HPV infection within the population. (Vaccine 2006, Vol. 24, Suppl 3; Vaccine 2008, Vol. 26, Suppl 10; Vaccine 2012, Vol. 30, Suppl 5; IARC Monographs 2007, Vol. 90).

### 4.1 HPV burden in women with normal cervical cytology, cervical precancerous lesions or invasive cervical cancer

The statistics shown in this section focus on HPV infection in the cervix uteri. HPV cervical infection results in cervical morphological lesions ranging from normalcy (cytologically normal women) to different stages of precancerous lesions (CIN-1, CIN-2, CIN-3/CIS) and invasive cervical cancer. HPV infection is measured by HPV DNA detection in cervical cells (fresh tissue, paraffin embedded or exfoliated cells). The prevalence of HPV increases with lesion severity. HPV causes virtually 100% of cervical cancer cases, and an underestimation of HPV prevalence in cervical cancer is most likely due to the limitations of study methodologies. Worldwide, HPV16 and 18 (the two vaccine-preventable types) contribute to over 70% of all cervical cancer cases, between 41% and 67% of high-grade cervical lesions and 16-32% of low-grade cervical lesions. After HPV16/18, the six most common HPV types are the same in all world regions, namely 31, 33, 35, 45, 52 and 58; these account for an additional 20% of cervical cancers worldwide (Clifford G, Vaccine 2006;24(S3):26).

#### **Methods: Prevalence and type distribution of human papillomavirus in cervical carcinoma, low-grade cervical lesions, high-grade cervical lesions and normal cytology: systematic review and meta-analysis**

A systematic review of the literature was conducted regarding the worldwide HPV-prevalence and type distribution for cervical carcinoma, low-grade cervical lesions, high-grade cervical lesions and normal cytology from 1990 to 'data as of' indicated in each section. The search terms for the review were 'HPV' AND cerv\* using Pubmed. There were no limits in publication language. References cited in selected articles were also investigated. Inclusion criteria were: HPV DNA detection by means of PCR or HC2, a minimum of 20 cases for cervical carcinoma, 20 cases for low-grade cervical lesions, 20 cases for highgrade cervical lesions and 100 cases for normal cytology and a detailed description of HPV DNA detection and genotyping techniques used. The number of cases tested and HPV positive extracted for each study were pooled to estimate the prevalence of HPV DNA and the HPV type distribution globally and by geographical region. Binomial 95% confidence intervals were calculated for each HPV prevalence. For more details refer to the methods document.

4.1.1 HPV prevalence in women with normal cervical cytology

<sup>a</sup> Number of women tested

<sup>b</sup> 95% Confidence Interval

Data Sources:

Systematic review and meta-analysis were performed by the ICO HPV Information Centre up to December 2011. Selected studies had to include at least 20 HIV positive women who had both normal cervical cytology and HPV test results (PCR or HC2).

#### 4.1.4 Terminology

##### **Cytologically normal women**

No abnormal cells are observed on the surface of their cervix upon cytology.

##### **Cervical Intraepithelial Neoplasia (CIN) / Squamous Intraepithelial Lesions (SIL)**

SIL and CIN are two commonly used terms to describe precancerous lesions or the abnormal growth of squamous cells observed in the cervix. SIL is an abnormal result derived from cervical cytological screening or Pap smear testing. CIN is a histological diagnosis made upon analysis of cervical tissue obtained by biopsy or surgical excision. The condition is graded as CIN 1, 2 or 3, according to the thickness of the abnormal epithelium (1/3, 2/3 or the entire thickness).

##### **Low-grade cervical lesions (LSIL/CIN-1)**

Low-grade cervical lesions are defined by early changes in size, shape, and number of abnormal cells formed on the surface of the cervix and may be referred to as mild dysplasia, LSIL, or CIN-1.

##### **High-grade cervical lesions (HSIL/ CIN-2 / CIN-3 / CIS)**

High-grade cervical lesions are defined by a large number of precancerous cells on the surface of the cervix that are distinctly different from normal cells. They have the potential to become cancerous cells and invade deeper tissues of the cervix. These lesions may be referred to as moderate or severe dysplasia, HSIL, CIN-2, CIN-3 or cervical carcinoma in situ (CIS).

##### **Carcinoma in situ (CIS)**

Preinvasive malignancy limited to the epithelium without invasion of the basement membrane. CIN 3 encompasses the squamous carcinoma in situ.

##### **Invasive cervical cancer (ICC) / Cervical cancer**

If the high-grade precancerous cells invade the basement membrane is called ICC. ICC stages range from stage I (cancer is in the cervix or uterus only) to stage IV (the cancer has spread to distant organs, such as the liver).

##### **Invasive squamous cell carcinoma**

Invasive carcinoma composed of cells resembling those of squamous epithelium.

##### **Adenocarcinoma**

Invasive tumour with glandular and squamous elements intermingled.

## 4.2 HPV burden in anogenital cancers other than cervix

### **Methods: Prevalence and type distribution of human papillomavirus in carcinoma of the vulva, vagina, anus and penis: systematic review and meta-analysis**

A systematic review of the literature was conducted on the worldwide HPV-prevalence and type distribution for anogenital carcinomas other than cervix from January 1986 to 'data as of' indicated in each section. The search terms for the review were 'HPV' AND (anus OR anal) OR (penile) OR vagin\* OR vulv\* using Pubmed. There were no limits in publication language. References cited in selected articles were also investigated. Inclusion criteria were: HPV DNA detection by means of PCR, a minimum of 10 cases by lesion and a detailed description of HPV DNA detection and genotyping techniques used. The number of cases tested and HPV positive cases were extracted for each study to estimate the prevalence of HPV DNA and the HPV type distribution. Binomial 95% confidence intervals were calculated for each HPV prevalence.

### 4.2.1 Anal cancer and precancerous anal lesions

Anal cancer is similar to cervical cancer with respect to overall HPV DNA positivity, with approximately 100% of anal squamous cell carcinoma cases associated with HPV infection worldwide (de Martel C et al. Lancet Glob Health 2020;8(2):e180-e190). HPV16 is the most common type detected, representing 73% of all HPV-positive tumours. HPV18 is the second most common type detected and is found in approximately 5% of cases. HPV DNA is also detected in the majority of precancerous anal lesions (AIN) (91.5% in AIN1 and 93.9% in AIN2/3) (De Vuyst H et al. Int J Cancer 2009; 124: 1626-36). In this section, the burden of HPV among cases of anal cancers and precancerous anal lesions in Greece are presented.

Table 25: Studies on HPV prevalence among anal cancer cases in Greece (male and female)

### 4.2.2 Vulvar cancer and precancerous vulvar lesions

HPV attribution for vulvar cancer is 48% among age 15-54 years, 28% among age 55-64 years, and 15% among age 65+ worldwide (de Martel C et al. Lancet Glob Health 2020;8(2):e180-e190). Vulvar cancer has two distinct histological patterns with two different risk factor profiles: (1) basaloid/warty types (2) keratinising types. Basaloid/warty lesions are more common in young women, are frequently found adjacent to VIN, are very often associated with HPV DNA detection (86%), and have a similar risk factor profile as cervical cancer. Keratinising vulvar carcinomas represent the majority of the vulvar lesions (>60%). These lesions develop from non HPV-related chronic vulvar dermatoses, especially lichen sclerosus and/or squamous hyperplasia, their immediate cancer precursor lesion is differentiated VIN, they occur more often in older women, and are rarely associated with HPV (6%) or with any of the other risk factors typical of cervical cancer. HPV prevalence is frequently detected among cases of high-grade VIN (VIN2/3) (85.3%). HPV 16 is the most common type detected followed by HPV 33 (De Vuyst H et al. Int J Cancer 2009; 124: 1626-36). In this section, the HPV burden among cases of vulvar cancer cases and precancerous vulvar lesions in Greece are presented.

### 4.2.3 Vaginal cancer and precancerous vaginal lesions

Vaginal and cervical cancers share similar risk factors and it is generally accepted that both carcinomas share the same aetiology of HPV infection although there is limited evidence available. Women with vaginal cancer are more likely to have a history of other ano-genital cancers, particularly of the cervix, and these two carcinomas are frequently diagnosed simultaneously. HPV DNA is detected among 78% of invasive vaginal carcinomas and 91% of high-grade vaginal neoplasias (VaIN2/3). HPV16 is the most common type in high-grade vaginal neoplasias and it is detected in at least 78% of HPV-positive carcinomas (de Martel C et al. Lancet Glob Health 2020;8(2):e180-e190; De Vuyst H et al. Int J Cancer 2009; 124:1626-36). In this section, the HPV burden among cases of vaginal cancer cases and precancerous vaginal lesions in Greece are presented.

#### 4.2.4 Penile cancer and precancerous penile lesions

HPV DNA is detectable in approximately 51% of all penile cancers (de Martel C et al. Lancet Glob Health 2020;8(2):e180-e190). Among HPV-related penile tumours, HPV16 is the most common type detected, followed by HPV18 and HPV types 6/11 (Miralles C et al. J Clin Pathol 2009;62:870-8). Over 95% of invasive penile cancers are SCC and the most common penile SCC histologic sub-types are keratinising (49%), mixed warty-basaloid (17%), verrucous (8%), warty (6%), and basaloid (4%). HPV is commonly detected in basaloid and warty tumours but is less common in keratinising and verrucous tumours. In this section, the HPV burden among cases of penile cancer cases and precancerous penile lesions in Greece are presented.

### 4.3 HPV burden in men

The information to date regarding anogenital HPV infection is primarily derived from cross-sectional studies of selected populations such as general population, university students, military recruits, and studies that examined husbands of control women, as well as from prospective studies. Special subgroups include mainly studies that examined STD (sexually transmitted diseases) clinic attendees, MSM (men who have sex with men), HIV positive men, and partners of women with HPV lesions, CIN (cervical intraepithelial neoplasia), cervical cancer or cervical carcinoma in situ. Globally, prevalence of external genital HPV infection in men is higher than cervical HPV infection in women, but persistence is less likely. As with genital HPV prevalence, high numbers of sexual partners increase the acquisition of oncogenic HPV infections (Vaccine 2012, Vol. 30, Suppl 5). In this section, the HPV burden among men in Greece is presented.

### Methods

HPV burden in men was based on published systematic reviews and meta-analyses (Dunne EF, J Infect Dis 2006; 194: 1044, Smith JS, J Adolesc Health 2011; 48: 540, Olesen TB, Sex Transm Infect 2014; 90: 455, and Hebnes JB, J Sex Med 2014; 11: 2630) up to October 31, 2015. The search terms for the review were human papillomavirus, men, polymerase chain reaction (PCR), hybrid capture (HC), and viral DNA. References cited in selected articles were also investigated. Inclusion criteria were: HPV DNA detection by means of PCR or HC (ISH if data are not available for the country), and a detailed description of HPV DNA detection and genotyping techniques used. The number of cases tested and HPV positive cases were extracted for each study to estimate the anogenital prevalence of HPV DNA. Binomial 95% confidence intervals were calculated for each anogenital HPV prevalence.

Based on published systematic reviews, the ICO HPV Information Centre has updated data until October 2015. Reference publications: 1) Dunne EF, J Infect Dis 2006; 194: 1044 2) Smith JS, J Adolesc Health 2011; 48: 540 3) Olesen TB, Sex Transm Infect 2014; 90: 455 4) Hebnes JB, J Sex Med 2014; 11: 2630.

## 4.4 HPV burden in the head and neck

The last evaluation of the International Agency for Research in Cancer (IARC) on the carcinogenicity of HPV in humans concluded that (a) there is enough evidence for the carcinogenicity of HPV type 16 in the oral cavity, oropharynx (including tonsil cancer, base of tongue cancer and other oropharyngeal cancer sites), and (b) limited evidence for laryngeal cancer (IARC Monograph Vol 100B). There is increasing evidence that HPV-related oropharyngeal cancers constitute an epidemiological, molecular and clinical distinct form as compared to non HPV-related ones. Some studies indicate that the most likely explanation for the origin of this distinct form of head and neck cancers associated with HPV is a sexually acquired oral HPV infection that is not cleared, persists and evolves into a neoplastic lesion. Around 30% of oropharyngeal cancers (which mainly comprises the tonsils and base of tongue sites) are caused by HPV with HPV16 being the most frequent type (de Martel C et al. Int J Cancer 2017;141(4):664-670). Attributable fraction varies greatly worldwide, being highest in more developed countries (60% in Republic of Korea, 51% in North America, 50% in Eastern Europe, 46% in Japan, 42% in North-Western Europe, 41% in Australia/New Zealand, 24% in South Europe, 23% in China, 22% in India, and 13% in elsewhere) (de Martel C et al. Lancet Glob Health 2020;8(2):e180-e190). In this section, the HPV burden in the head and neck in Greece is presented.

## 5 Factors contributing to cervical cancer

HPV is a necessary cause of cervical cancer, but it is not a sufficient cause. Other cofactors are necessary for progression from cervical HPV infection to cancer. Tobacco smoking, high parity, long-term hormonal contraceptive use, and co-infection with HIV have been identified as established cofactors. Co-infection with Chlamydia trachomatis and herpes simplex virus type-2, immunosuppression, and certain dietary deficiencies are other probable cofactors. Genetic and immunological host factors and viral factors other than type, such as variants of type, viral load and viral integration, are likely to be important but have not been clearly identified. (Muñoz N, Vaccine 2006; 24(S3): 1-10). In this section, the prevalence of smoking, parity (fertility), oral contraceptive use, and HIV in Greece are presented.

Table 39: Factors contributing to cervical carcinogenesis (cofactors) in Greece

INDICATOR		MALE	FEMALE	TOTAL
<b>Smoking</b>				
Smoking of any tobacco adjusted prevalence (%) [95% UI]	Current <sup>a</sup>	51.1 [38.3-66.2]	32 [21.8-43.7]	41.2 [29.8-54.6]

### Data accessed on 12 Nov 2019

Crude adjusted prevalence (%) estimates of tobacco use among people aged ≥ 15 years by country, for the year 2016.

<sup>a</sup> "Current" means smoking at the time of the survey, including both daily and non-daily or occasional smoking. "Tobacco smoking" means smoking any form of tobacco, including cigarettes, cigars, pipes, or any other smoked tobacco products and excluding smokeless products.

<sup>b</sup> "Daily" means smoking every day at the time of the survey. "Tobacco smoking" means smoking any form of tobacco, including cigarettes, cigars, pipes, or any other smoked tobacco products and excluding smokeless products.

<sup>c</sup> "Current" means smoking at the time of the survey, including both daily and non-daily or occasional smoking.

<sup>d</sup> "Daily" means smoking every day at the time of the survey.

Data pertain to sexually active women of reproductive age.

Year of estimate: 2016

## 6 Sexual and reproductive health behaviour indicators

Sexual intercourse is the primary route of transmission of genital HPV infection. Information about sexual and reproductive health behaviours is essential to the design of effective preventive strategies against anogenital cancers. In this section, we describe sexual and reproductive health indicators that may be used as proxy measures of risk for HPV infection and anogenital cancers. Several studies have reported that earlier sexual debut is a risk factor for HPV infection, although the reason for this relationship is still unclear. In this section, information on sexual and reproductive health behaviour in Greece are presented.

Table 40: Percentage of 15-year-olds who have had sexual intercourse in Greece

Indicator	Male	Female
Percentage of 15-year-old subjects who report sexual intercourse	35.0	17.0

Data accessed on 16 Mar 2017

Please refer to original source for methods of estimation

Fifteen-year-olds teenagers only were asked whether they had ever had sexual intercourse.

Indicates a significant gender difference (at  $p < 0.05$ ).

## 7 HPV preventive strategies

It is established that well-organised cervical screening programmes or widespread good quality cytology can reduce cervical cancer incidence and mortality. The introduction of HPV vaccination could also effectively reduce the burden of cervical cancer in the coming decades. This section presents indicators on basic characteristics and performance of cervical cancer screening, status of HPV vaccine licensure and introduction in Greece.

### 7.1 Cervical cancer screening practices

Screening strategies differ between countries. Some countries have population-based programmes, where in each round of screening women in the target population are individually identified and invited to attend screening. This type of programme can be implemented nationwide or only in specific regions of the country. In opportunistic screening, invitations depend on the individual's decision or on encounters with health-care providers. The most frequent method for cervical cancer screening is cytology, and there are alternative methods such as HPV DNA tests and visual inspection with acetic acid (VIA). VIA is an alternative to cytology-based screening in low-resource settings (the 'see and treat' approach). HPV DNA testing is being introduced into some countries as an adjunct to cytology screening ('co-testing') or as the primary screening test to be followed by a secondary, more specific test, such as cytology.

Table 45: Main characteristics of cervical cancer screening in Greece

Region	Existence of official national recommendations	Starting year of current recommendations	Active invitation to screening	Screening ages (years), primary screening test used, and screening interval or frequency of screenings
Greece	Yes	2018	No	>=18 (cytology, 1 year); 21-60 (HPV test, 5 years)

## 8 Protective factors for cervical cancer

Male circumcision and the use of condoms have shown a significant protective effect against HPV transmission.

Table 47: Prevalence of male circumcision in Greece

Reference	Prevalence % (95% CI)	Methods
WHO 2007	<20	Data from Demographic and Health Surveys (DHS) and other publications to categorize the country-wide prevalence of male circumcision as <20%, 20-80%, or >80%.

### Data accessed on 31 Aug 2015

## 10 Glossary

Table 49: Glossary

Term	Definition
Incidence	Incidence is the number of new cases arising in a given period in a specified population. This information is collected routinely by cancer registries. It can be expressed as an absolute number of cases per year or as a rate per 100,000 persons per year (see Crude rate and ASR below). The rate provides an approximation of the average risk of developing a cancer.
Mortality	Mortality is the number of deaths occurring in a given period in a specified population. It can be expressed as an absolute number of deaths per year or as a rate per 100,000 persons per year.
Prevalence	The prevalence of a particular cancer can be defined as the number of persons in a defined population who have been diagnosed with that type of cancer, and who are still alive at the end of a given year, the survivors. Complete prevalence represents the number of persons alive at certain point in time who previously had a diagnosis of the disease, regardless of how long ago the diagnosis was, or if the patient is still under treatment or is considered cured. Partial prevalence, which limits the number of patients to those diagnosed during a fixed time in the past, is a particularly useful measure of cancer burden. Prevalence of cancers based on cases diagnosed within one, three and five years are presented as they are likely to be of relevance to the different stages of cancer therapy, namely, initial treatment (one year), clinical follow-up (three years) and cure (five years). Patients who are still alive five years after diagnosis are usually considered cured since the death rates of such patients are similar to those in the general population. There are exceptions, particularly breast cancer. Prevalence is presented for the adult population only (ages 15 and over), and is available both as numbers and as proportions per 100,000 persons.
Crude rate	Data on incidence or mortality are often presented as rates. For a specific tumour and population, a crude rate is calculated simply by dividing the number of new cancers or cancer deaths observed during a given time period by the corresponding number of person years in the population at risk. For cancer, the result is usually expressed as an annual rate per 100,000 persons at risk.
ASR (age-standardised rate)	An age-standardised rate (ASR) is a summary measure of the rate that a population would have if it had a standard age structure. Standardization is necessary when comparing several populations that differ with respect to age because age has a powerful influence on the risk of cancer. The ASR is a weighted mean of the age-specific rates; the weights are taken from population distribution of the standard population. The most frequently used standard population is the World Standard Population. The calculated incidence or mortality rate is then called age-standardised incidence or mortality rate (world). It is also expressed per 100,000. The world standard population used in GLOBOCAN is as proposed by Segi [1] and modified by Doll and al. [2]. The age-standardised rate is calculated using 10 age-groups. The result may be slightly different from that computed using the same data categorised using the traditional 5 year age bands.

Continued on next page

**Table 49 – continued from previous page**

<b>Term</b>	<b>Definition</b>
Cumulative risk	Cumulative incidence/mortality is the probability or risk of individuals getting/dying from the disease during a specified period. For cancer, it is expressed as the number of new born children (out of 100, or 1000) who would be expected to develop/die from a particular cancer before the age of 75 if they had the rates of cancer observed in the period in the absence of competing causes.
Cytologically normal women	No abnormal cells are observed on the surface of their cervix upon cytology.
Cervical Intraepithelial Neoplasia (CIN) / Squamous Intraepithelial Lesions (SIL)	SIL and CIN are two commonly used terms to describe precancerous lesions or the abnormal growth of squamous cells observed in the cervix. SIL is an abnormal result derived from cervical cytological screening or Pap smear testing. CIN is a histological diagnosis made upon analysis of cervical tissue obtained by biopsy or surgical excision. The condition is graded as CIN 1, 2 or 3, according to the thickness of the abnormal epithelium (1/3, 2/3 or the entire thickness).
Low-grade cervical lesions (LSIL/CIN-1)	Low-grade cervical lesions are defined by early changes in size, shape, and number of abnormal cells formed on the surface of the cervix and may be referred to as mild dysplasia, LSIL, or CIN-1.
High-grade cervical lesions (HSIL / CIN-2 / CIN-3 / CIS)	High-grade cervical lesions are defined by a large number of precancerous cells on the surface of the cervix that are distinctly different from normal cells. They have the potential to become cancerous cells and invade deeper tissues of the cervix. These lesions may be referred to as moderate or severe dysplasia, HSIL, CIN-2, CIN-3 or cervical carcinoma in situ (CIS).
Carcinoma in situ (CIS)	Preinvasive malignancy limited to the epithelium without invasion of the basement membrane. CIN 3 encompasses the squamous carcinoma in situ.
Invasive cervical cancer (ICC) / Cervical cancer	If the high-grade precancerous cells invade the basement membrane is called ICC. ICC stages range from stage I (cancer is in the cervix or uterus only) to stage IV (the cancer has spread to distant organs, such as the liver).
Adenocarcinoma	Invasive tumour with glandular and squamous elements intermingled

## Acknowledgments

This report has been developed by the Unit of Infections and Cancer, Cancer Epidemiology Research Program, at the Institut Català d'Oncologia (ICO, Catalan Institute of Oncology). This report was supported by a grant from the Instituto de Salud Carlos III (Spanish Government) through the projects PI18/01137, PI21/00982, PI22/00219 and CIBERESP CB06/02/0073, and the Secretariat for Universities and Research of the Department of Business and knowledge of the Government of Catalonia grants to support the activities of research groups (SGR 2017–2021) (Grant number 2017SRG1718 and 2021SGR01029). The report has also received funding from the European Union's Horizon 2020 research and innovation program under grant agreement No. 847845. We thank the CERCA Program / Generalitat de Catalunya for institutional support. The HPV Information Centre is being developed by the ICO. The Centre was originally launched by ICO with the collaboration of WHO's Immunisation, Vaccines and Biologicals (IVB) department and support from the Bill and Melinda Gates Foundation.
