Human Papillomavirus and Related Cancers, Fact Sheet 2021 (2021-10-22)

I. Key data on HPV and HPV-related cancers

Myanmar has a population of 21.0 millions women ages 15 years and older who are at risk of developing cervical cancer. Current estimates indicate that every year 7129 women are diagnosed with cervical cancer and 4497 die from the disease.

Cervical cancer ranks as the

1st most frequent cancer among women in Myanmar and the 1st most frequent cancer among women between 15 and 44 years of age. Data is not yet available on the HPV burden in the general population of Myanmar. However, in South-Eastern Asia, the region Myanmar belongs to, about 3.0% of women in the general population are estimated to harbour cervical HPV-16/18 infection at a given time, and 70.4% of invasive cervical cancers are attributed to HPVs 16 or 18.
