Human Papillomavirus and Related Cancers, Fact Sheet 2023 (2023-03-10)

I. Key data on HPV and HPV-related cancers

Saudi Arabia has a population of 10.7 million women ages 15 years and older who are at risk of developing cervical cancer. Current estimates indicate that every year 358 women are diagnosed with cervical cancer and 179 die from the disease.

Cervical cancer ranks as the 8th most frequent cancer among women in Saudi Arabia and the 8th most frequent cancer among women between 15 and 44 years of age. Data is not yet available on the HPV burden in the general population of Saudi Arabia. However, in Western Asia, the region Saudi Arabia belongs to, about 2.5% of women in the general population are estimated to harbour cervical HPV-16/18 infection at a given time, and 72.4% of invasive cervical cancers are attributed to HPVs 16 or 18.
